

Learning how to prove Workshop Week 9

Groups

Group Homomorphisms

1. Let $G_1 \times G_2$ be the direct product of two groups G_1 and G_2 . We define

$$\begin{aligned} \pi_1 : G_1 \times G_2 &\rightarrow G_1 & \text{by } \pi_1(g_1, g_2) &= g_1 \\ \iota_1 : G_1 &\rightarrow G_1 \times G_2 & \text{by } \iota_1(g_1) &= (g_1, 1_{G_2}) \end{aligned}$$

Prove

- (a) π_1 is an epimorphism, called the **projection onto** G_1 .
- (b) ι_1 is a monomorphism, called the **injection of** G_1 **onto** $G_1 \times G_2$.

Similarly, we can define a **projection onto** G_2 , and an **injection of** G_2 **onto** $G_1 \times G_2$.

Solution: (a) Let $(g_1, g_2), (g'_1, g'_2) \in G_1 \times G_2$. Then

$$\pi_1[(g_1, g_2)(g'_1, g'_2)] = \pi_1(g_1g'_1, g_2g'_2) = g_1g'_1 = \pi_1(g_1, g_2)\pi_1(g'_1, g'_2).$$

Thus π_1 is a homomorphism. It remains to show that π_1 is surjective but it clearly holds, since $\pi_1(g_1, 1_{G_2}) = g_1$ for all $g_1 \in G_1$.

- (b) Given $g_1, g'_1 \in G_1$ we have that

$$\iota_1(g_1g'_1) = (g_1g'_1, 1_{G_2}) = (g_1, 1_{G_2})(g'_1, 1_{G_2}) = \iota_1(g_1)\iota_1(g'_1),$$

which shows that ι_1 is a homomorphism. Moreover, ι_1 is one-to-one since

$$\iota_1(g_1) = \iota_1(g'_1) \Rightarrow (g_1, 1_{G_2}) = (g'_1, 1_{G_2}) \Rightarrow g_1 = g'_1.$$

2. Let n be a nonzero integer, and consider the subgroup $n\mathbb{Z} = \{nk \mid k \in \mathbb{Z}\}$ of $\mathbb{Z}$.
- (a) Prove that $\mathbb{Z} \cong n\mathbb{Z}$.
 - (b) Show that $n\mathbb{Z} \cong m\mathbb{Z}$ for all $n \neq 0$ and $m \neq 0$.

Solution: (a) The mapping $\varphi : \mathbb{Z} \rightarrow n\mathbb{Z}$ given by $\varphi(k) = nk$ is clearly surjective, and φ is one-to-one because $\varphi(k) = \varphi(k')$ implies that $nk = nk'$, i.e., $n(k - k') = 0$ which yields that $k = k'$.

To finish, let us prove that φ is a homomorphism:

$$\varphi(k + k') = n(k + k') = nk + nk' = \varphi(k) + \varphi(k'),$$

for all $k, k' \in \mathbb{Z}$. Thus φ is an isomorphism, and so $\mathbb{Z} \cong n\mathbb{Z}$.

- (b) Let $n, m \in \mathbb{Z}$ nonzero integers. By (a) we have that $\mathbb{Z} \cong n\mathbb{Z}$ and $\mathbb{Z} \cong m\mathbb{Z}$ and since $\cong$ is an equivalence relation we can conclude that $n\mathbb{Z} \cong m\mathbb{Z}$, as desired.
