

Let X be the number of americans that have bought the product
The sample proportion p has estimator
$$\hat{p} = \frac{X}{n}$$

where $X \sim B(n, p)$ (X binomial, success = p)
Then $\mu_{\hat{p}} = E(\hat{p}) = \frac{E(X)}{n}$. Taking 672 as a point estimate for X (i.e., $E(X) = 672$), we get a point estimate for $E(\hat{p}) = \frac{672}{1018} = 0.66$

$$\text{Now } V(\hat{p}) = V\left(\frac{X}{n}\right) = \frac{V(X)}{n^2} = \frac{n\hat{p}(1-\hat{p})}{n^2} = \frac{\hat{p}(1-\hat{p})}{n}$$
$$\therefore \sigma_{\hat{p}} = \sqrt{\frac{0.66(1-0.66)}{1018}} = 0.01$$
